

APPLICATION FOR
UNITED STATES LETTERS PATENT

SPECIFICATION

TO ALL WHOM IT MAY CONCERN:

Be it known that I, Lance Justis, a citizen of the United States of America, and resident of the State of Connecticut, having a postal address of 65 B Riverside Avenue, Norwalk, Connecticut, 06850, have invented a new and useful **"Anchoring Apparatus For Musical Instrument Stands"**, of which the following forms the specification.

“Anchoring Apparatus For Musical Instrument Stands”

BACKGROUND OF THE INVENTION

CROSS REFERENCE TO RELATED APPLICATIONS

Not applicable.

5 **Field of the Invention**

The present invention relates to the field of musical instrument anchoring systems in general and in particular to an anchoring system that is specifically designed to anchor the legs of cymbal, drum and snare stands.

Description of Related Art

10 As can be seen by reference to the following U.S. Patent Nos. 5,743,506; 5,994,634; 5,823,492; 5,868,372; and, 6,119,998, the prior art is replete with myriad and diverse arrangements for protecting carpets from damage caused by heavy objects resting on the carpet surface.

15 While all of the aforementioned prior art constructions are more than adequate for the basic purpose and function for which they have been specifically designed, they are uniformly deficient with respect to their failure to realize that this broad concept has other practical applications specifically in the music industry wherein, it is necessary to stabilize or temporarily anchor a percussion musical instrument on a carpeted surface.

As most musicians are all too well aware, when playing different venues, the rubber capped feet of percussive instrument stands do not provide adequate purchase or stability when resting on a carpeted surface.

5 As a consequence of the foregoing situation, there has existed a longstanding need among musicians for a new and improved instrument anchoring apparatus that securely positions a percussive instrument stand on a carpeted surface in a quick and efficient manner; and, the provision of such an apparatus in the stated objective of the present invention.

BRIEF SUMMARY OF THE INVENTION

10 Briefly stated, the anchor apparatus that forms the basis of the present invention comprises in general a base unit and a capture unit preferably formed integrally with one another wherein, a portion of the base unit is adapted to captively engage a carpeted surface and the capture unit is adapted to slidably receive and laterally immobilize one of the feet of a musical instrument support stand.

15 As will be explained in greater detail further on in the specification, the base unit comprises in general a thin, flat base member having a bottom surface provided with the hooked portion of a hook and loop fastener.

20 In addition, the capture unit comprises a raised wall member that extends upwardly from the top surface of the base member, and further defines a vertical opening that is dimensioned to laterally receive and immobilize one of the foot portions of a musical instrument stand.

BRIEF DESCRIPTION OF THE SEVERAL VIEWS OF THE DRAWINGS

25 These and other attributes of the invention will become more clear upon a thorough study of the following description of the best mode for carrying out the invention, particularly when reviewed in conjunction with the drawings, wherein:

FIG. 1 is a perspective view of the anchoring apparatus that forms the basis of the present invention in use;

FIG. 2 is a top plan view of one of the preferred embodiments of the invention;

FIG. 3 is a bottom perspective view of the base unit;

30 FIG. 4 is a perspective view of another preferred embodiment of the invention;

FIG. 5 is a side elevation view of the anchoring apparatus; and,

FIG. 6 is a top plan view of the second version of the preferred embodiment.

DETAILED DESCRIPTION OF THE INVENTION

As can be seen by reference to the drawings, and in particular to FIG. 1, the anchoring apparatus for musical instrument stands that forms the basis of the present invention is designated generally by the reference number **10**. The anchoring apparatus **10** comprises in general a base unit **11**, and a capture unit **12**. These units will now be described in seriatim fashion.

As can best be seen by reference to Figs. 2 through 4, the base unit **11** comprises a generally thin, flat base member **20** having a top surface **21** and a bottom surface **22** wherein, the bottom surface **22** is further provided with the hooked portion **23** of a conventional hook and loop fastener.

Turning now to Figs. 2,4, and 6, it can be seen that the capture unit **12** comprises a raised wall member **30** formed integrally with, and extending upwardly from, the top surface **21** of the base member **20** wherein, the raised wall member **30** is provided with an opening **31** that is dimensioned to laterally to receive the foot portion **102** of one of the support legs **101** of a musical instrument support stand **100**.

Furthermore, as can best be appreciated by reference to Figs. 2 and 6, in the first version of the preferred embodiment, the raised wall member **30** has an arcuate, generally C-shaped configuration wherein, in the second version of the preferred embodiment, the front portion **32** of the raised wall member **30** is slightly curved and further connects a pair of opposed generally straight side wall portions **33 34** to one another.

It should be noted at this juncture that the generally straight side wall portions **33 34** of the second version of the preferred embodiment are provided to restrict any lateral displacement of the foot portion **102** of the musical instrument support stand **100** relative to the raised wall member **30**.

In use, a plurality of anchor apparatuses **10** would be operatively engaged with the foot portions **102** of a like plurality of the support legs **101** of a musical instrument support stand **100** wherein, the hooked element **23** would engage the surface of a rug (not shown) to stabilize the instrument support stand **100** as previously described

herein. It should further be noted at this juncture that in both of the preferred versions, the base member **20** and the raised wall member are fabricated from hard rubber.

5 Although only an exemplary embodiment of the invention has been described in detail above, those skilled in the art will readily appreciate that many modifications are possible without materially departing from the novel teachings and advantages of this invention. Accordingly, all such modifications are intended to be included within the scope of this invention as defined in the following claims.

10 Having thereby described the subject matter of the present invention, it should be apparent that many substitutions, modifications, and variations of the invention are possible in light of the above teachings. It is therefore to be understood that the invention as taught and described herein is only to be limited to the extent of the breadth and scope of the appended claims.
